.NET MAUI Takes on the Web
…and more

David Ortinau | Principal Product Manager, .NET

Microsoft

You shouldn't have to choose

If I just build a website ...

Big deal CEO wants in the App Store too...

But I need offline and GPS and and and

Blazor gav
depth. Hy

You know, Ortinau had my hairstyle in the 2000s too, so...

What is Blazor Hybrid?

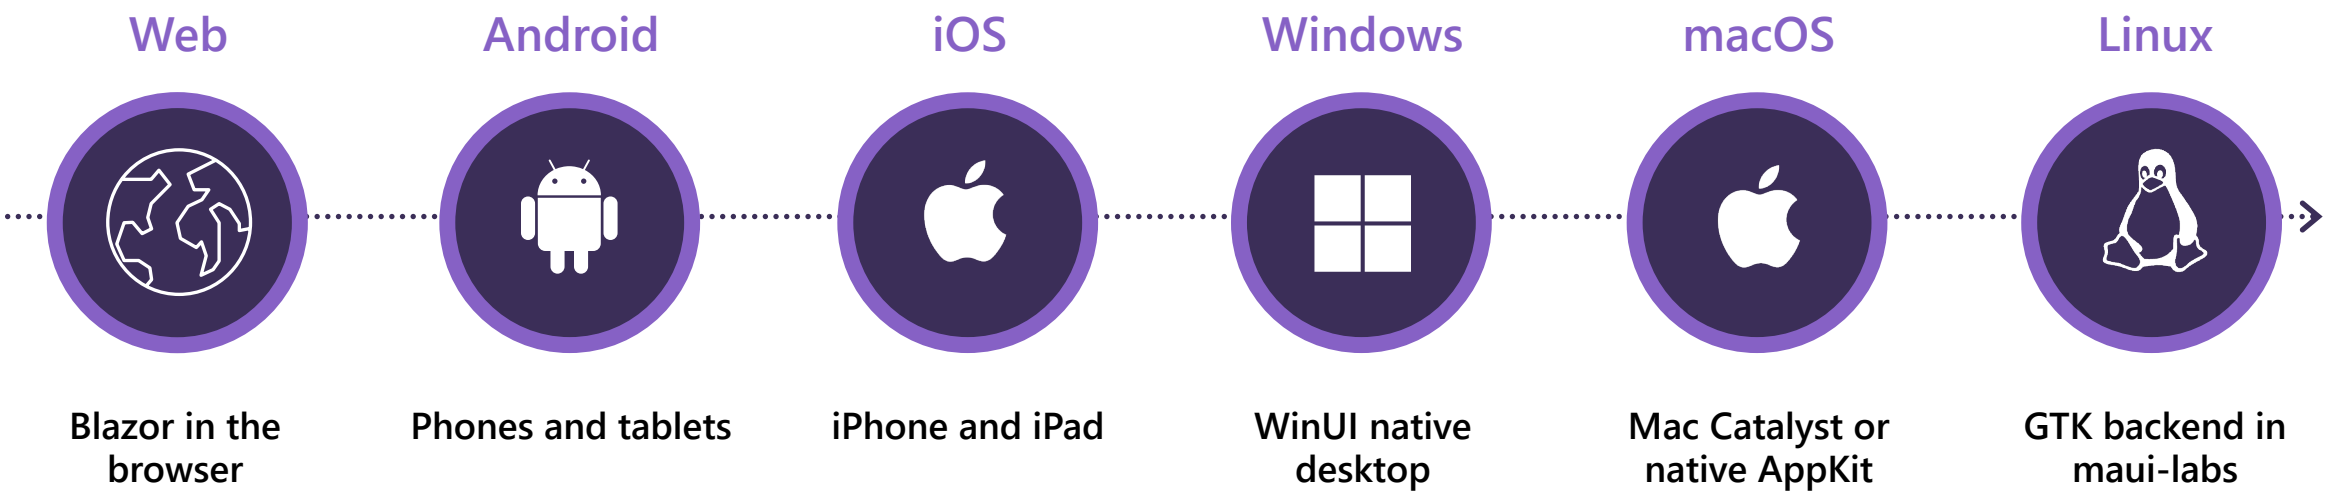

Your Razor components run natively inside the platform WebView.

No WebAssembly, no server round-trip, and the web assets ship in the app so it works offline.

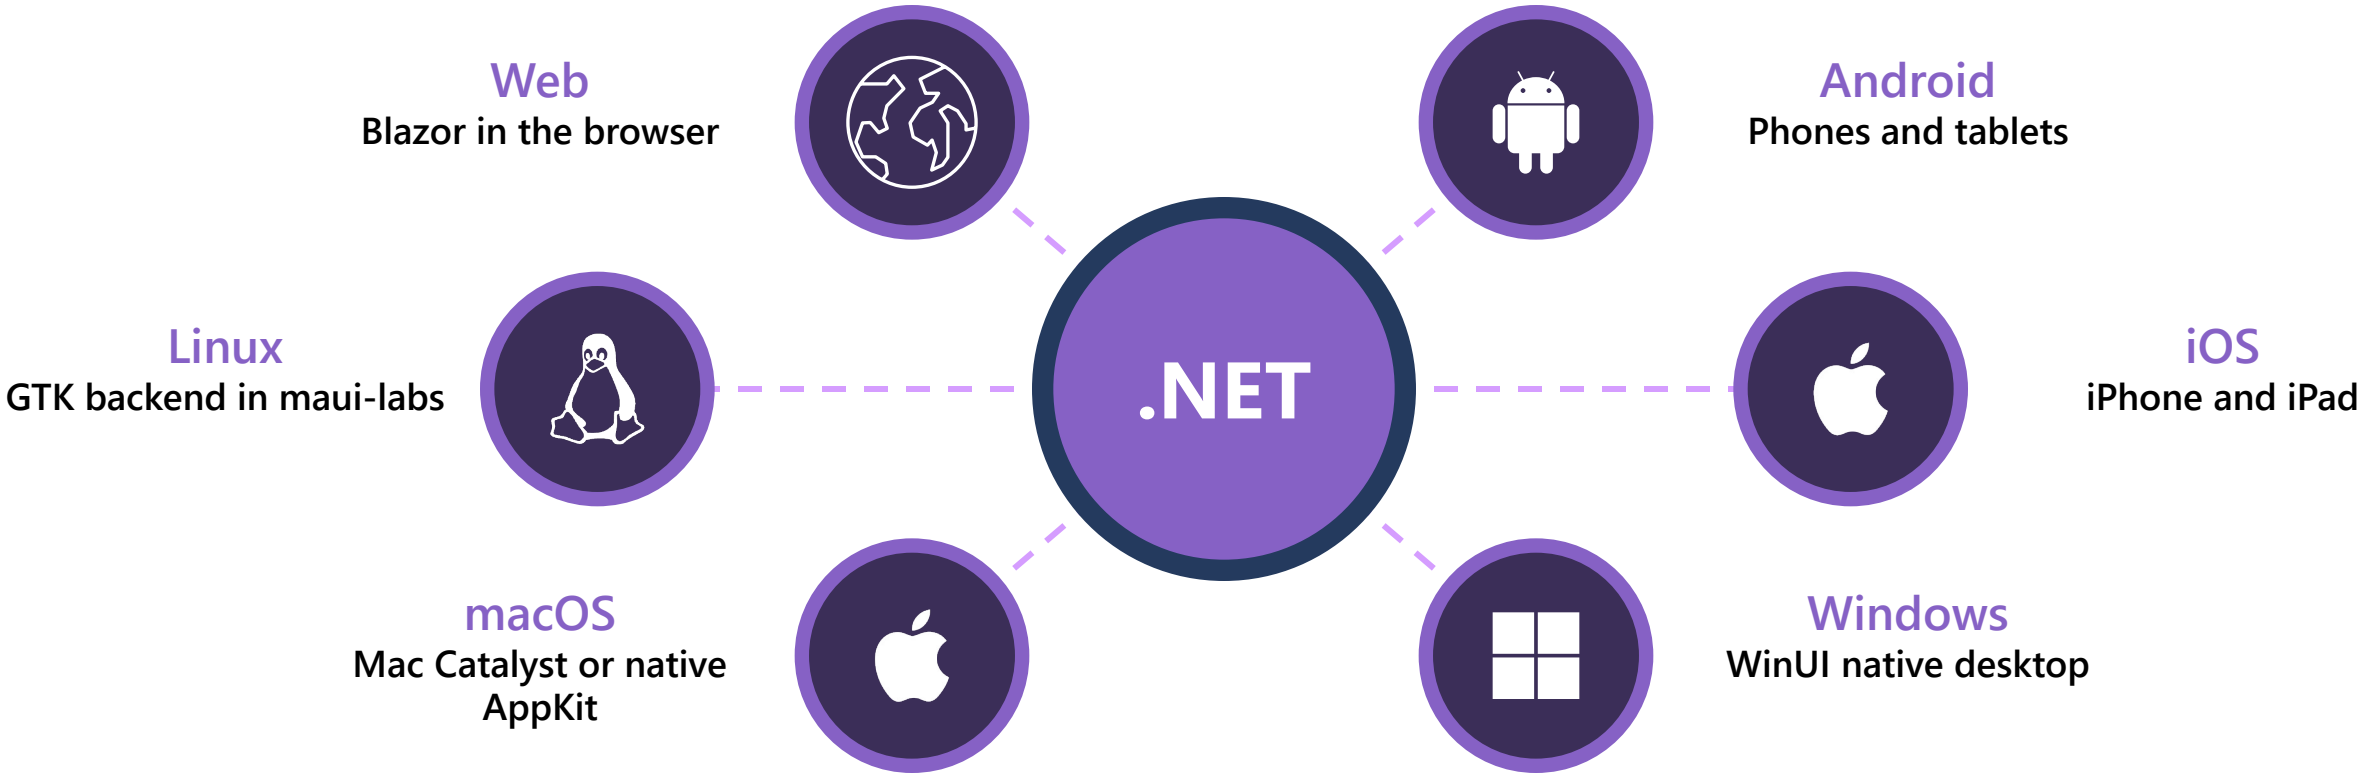

Through MAUI you also get full access to native device APIs.

One UI. Every screen.

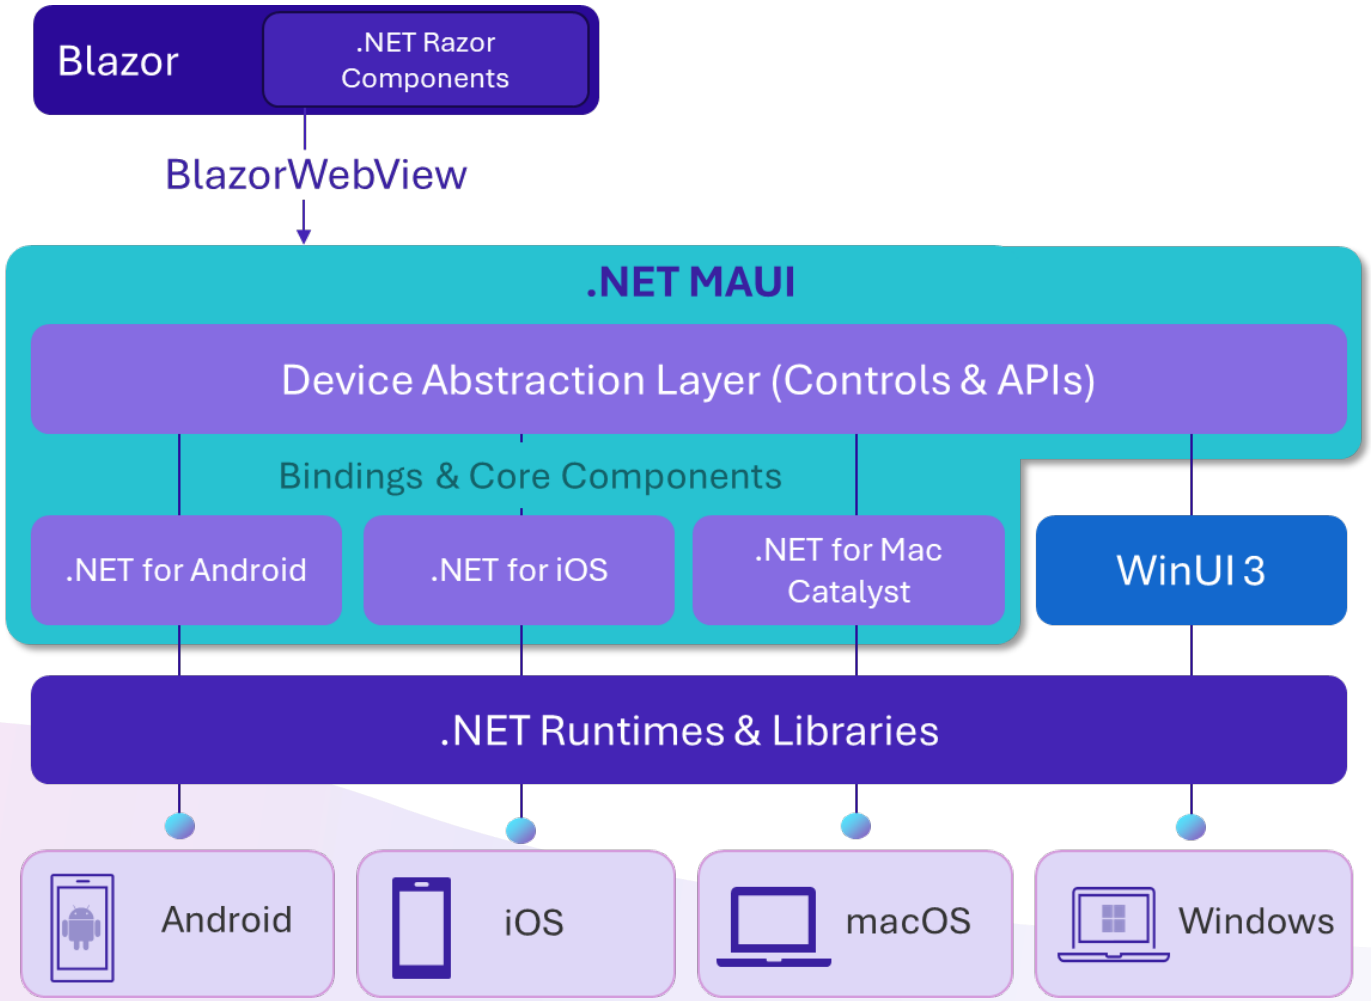

One UI. Every screen.

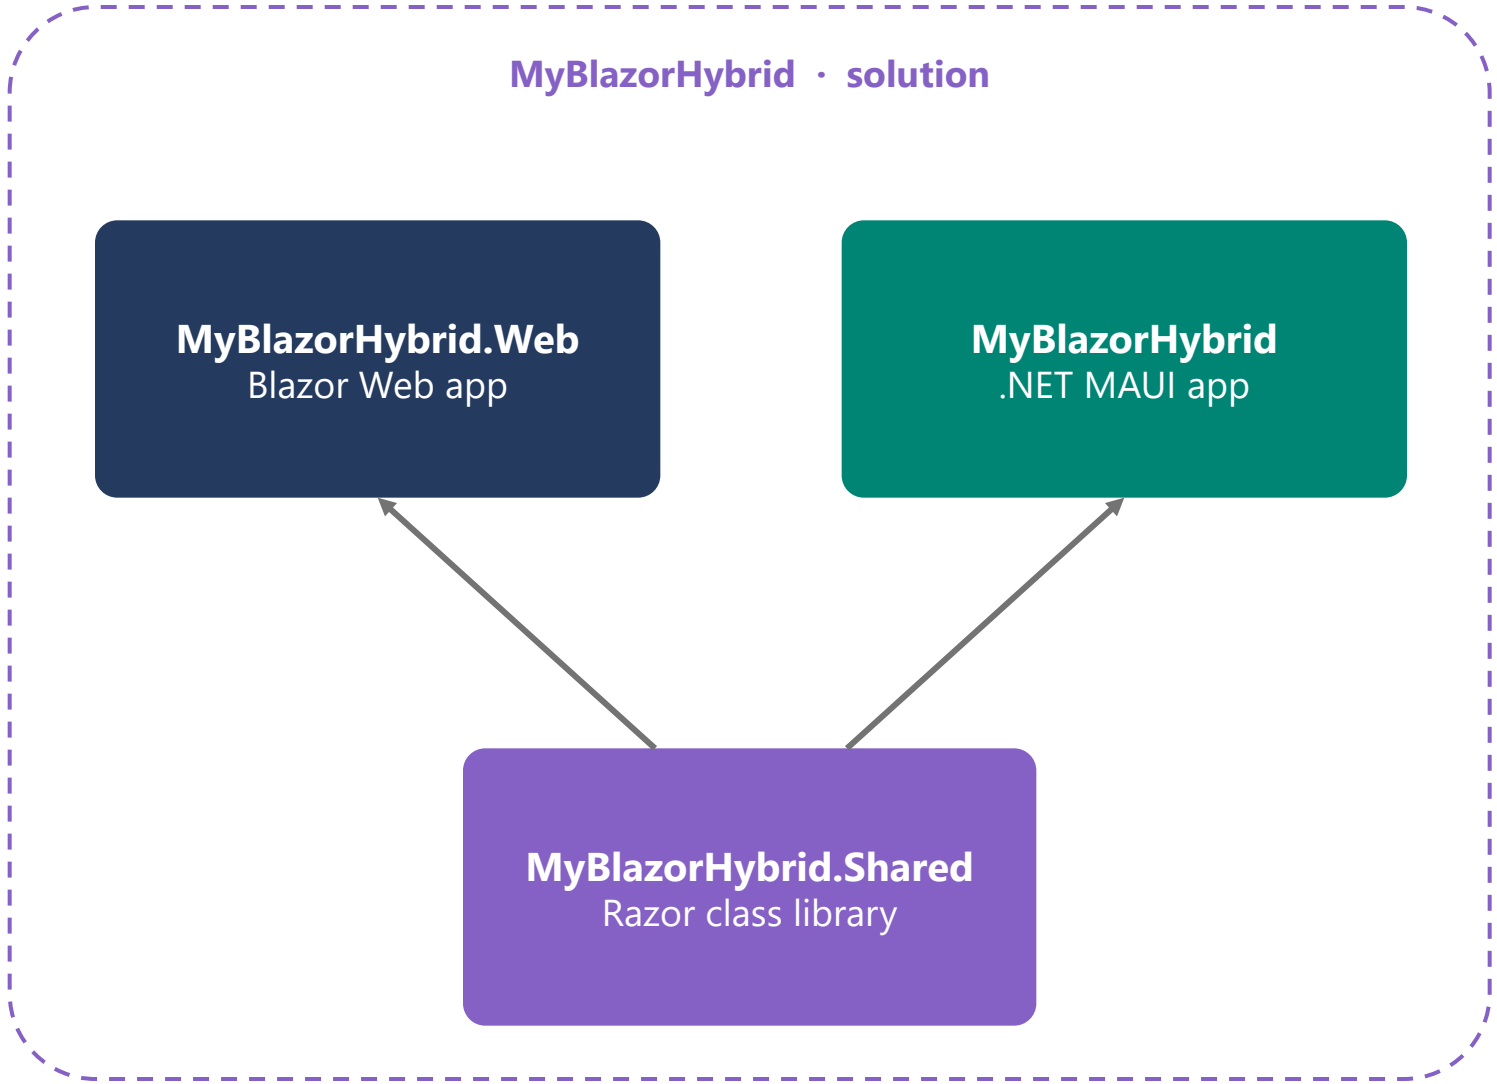

.NET MAUI Blazor Hybrid

Build native, multi-platform apps with Blazor web UI.

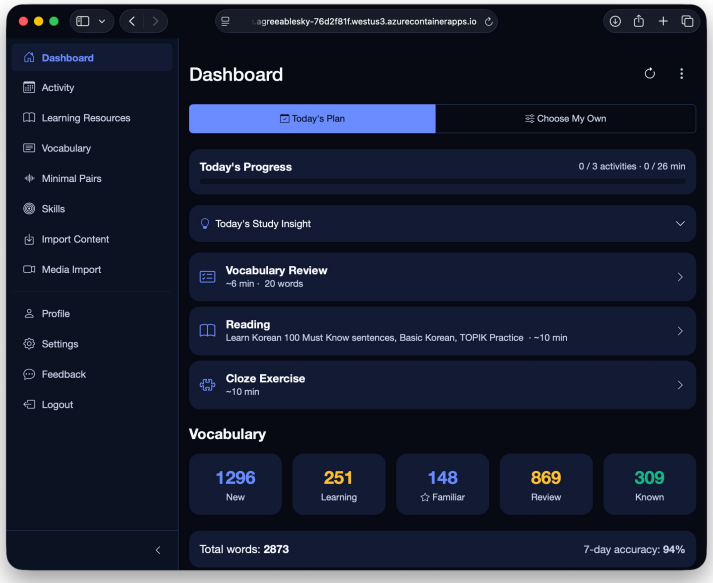

One template wires it all up

dotnet new maui-blazor-web

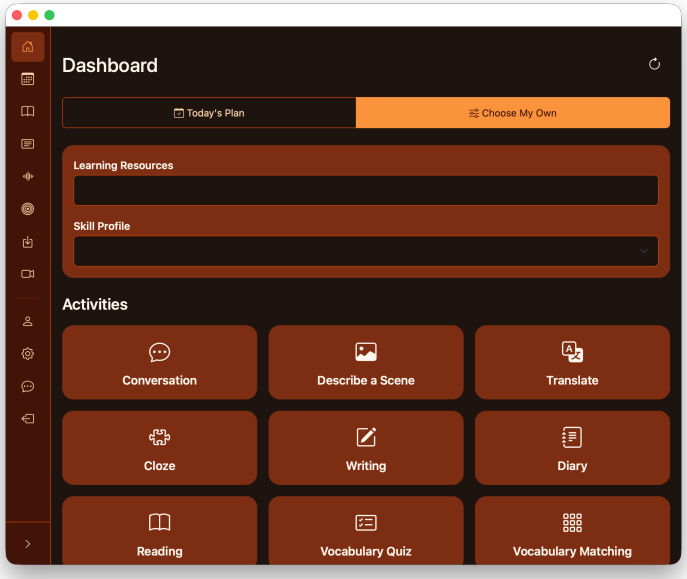

Sentence Studio

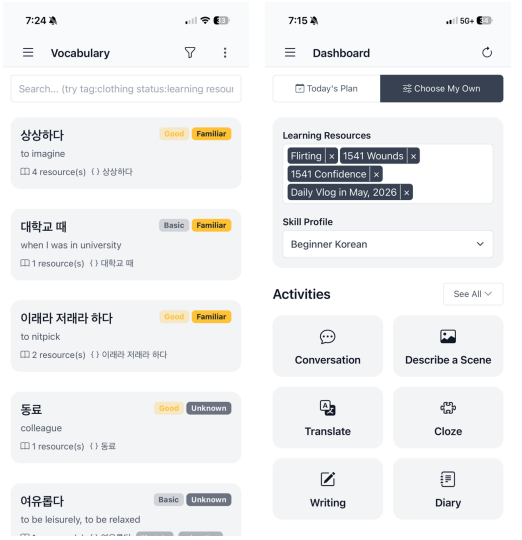

One Blazor UI, running natively on **browser, desktop, and mobile**. Models hosted in Microsoft Foundry; the whole system orchestrated with Aspire.

Browser

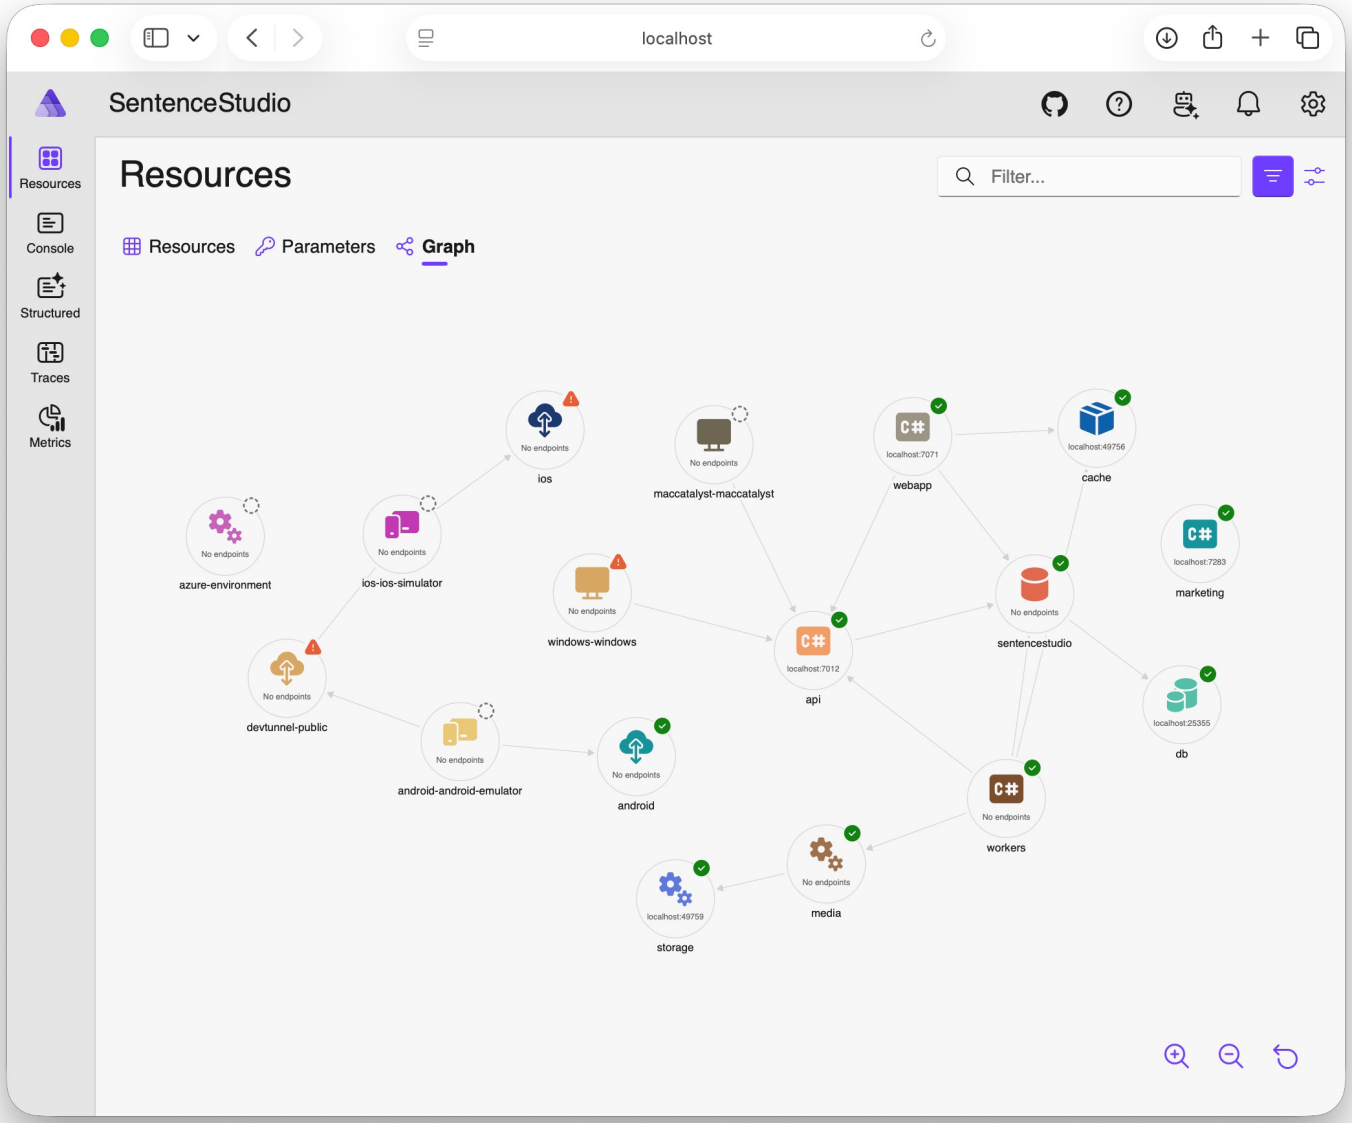

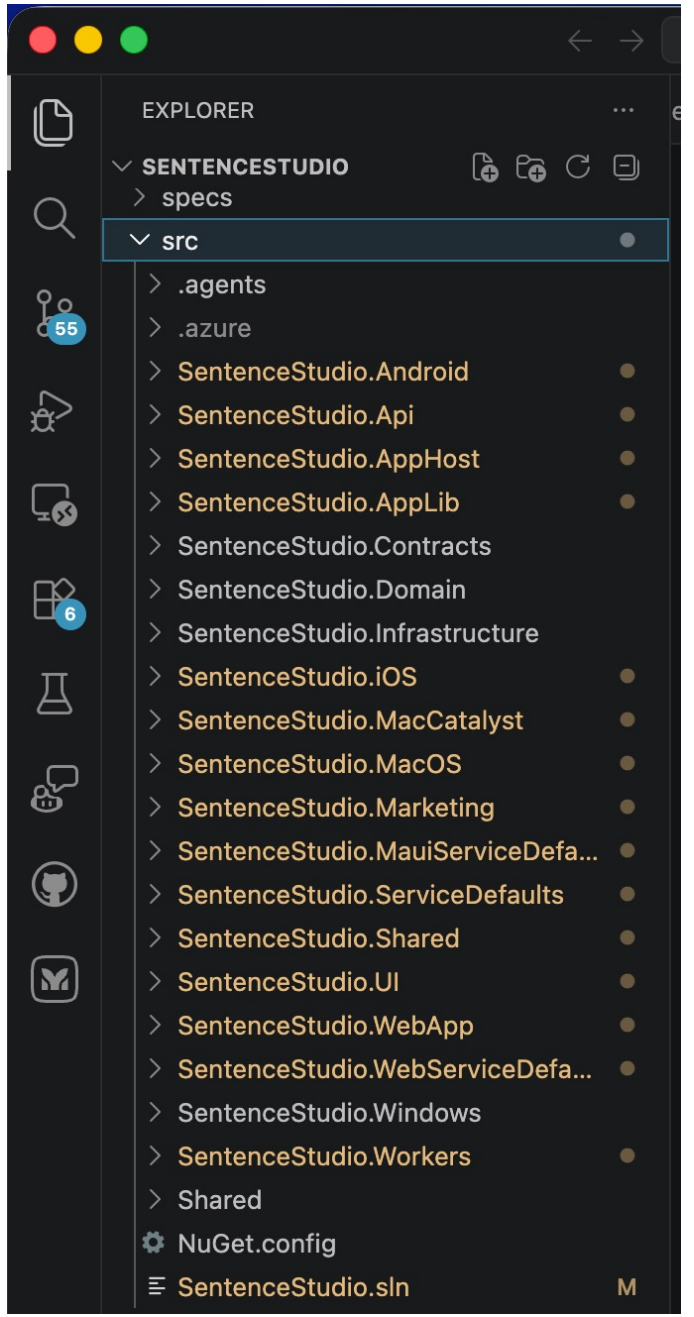

Desktop

Mobile

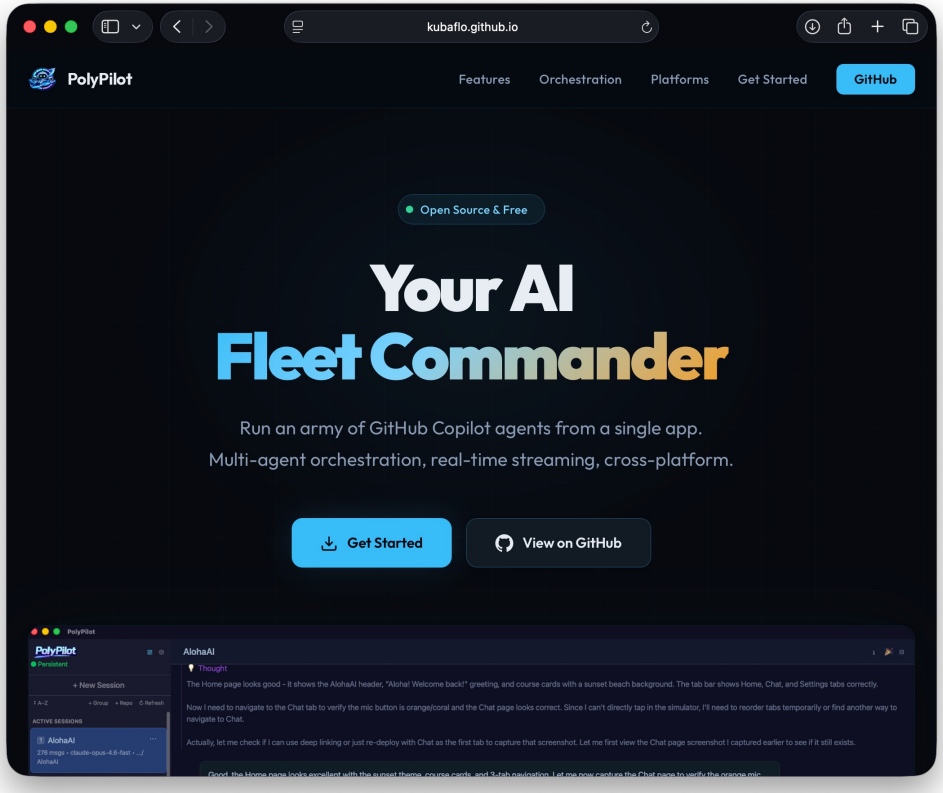

Aspire orchestration

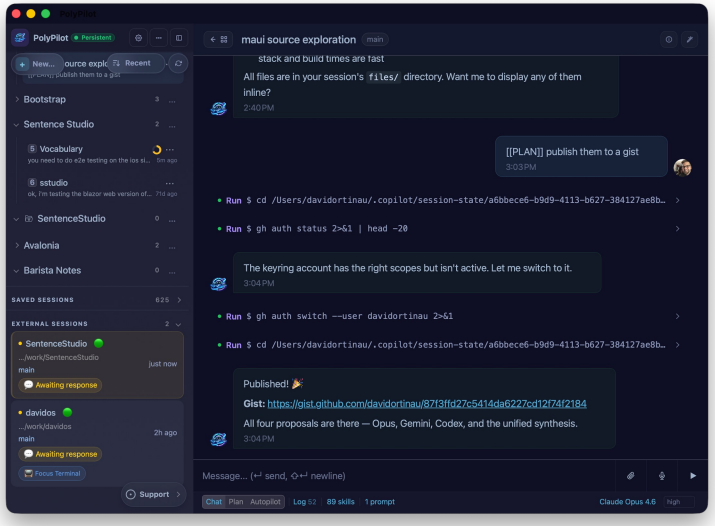

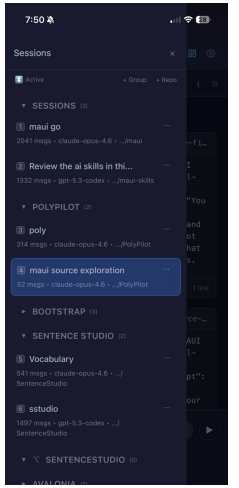

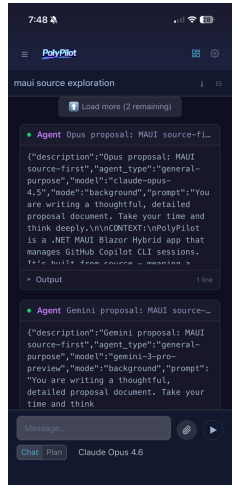

PolyPilot

An AI fleet commander built fast on the GitHub Copilot SDK. Ideated with Copilot, then redeployed across **browser, desktop, and mobile** — showing how Blazor Hybrid powers rapid experimentation on every platform.

Desktop

Mobile

Coming in .NET 11

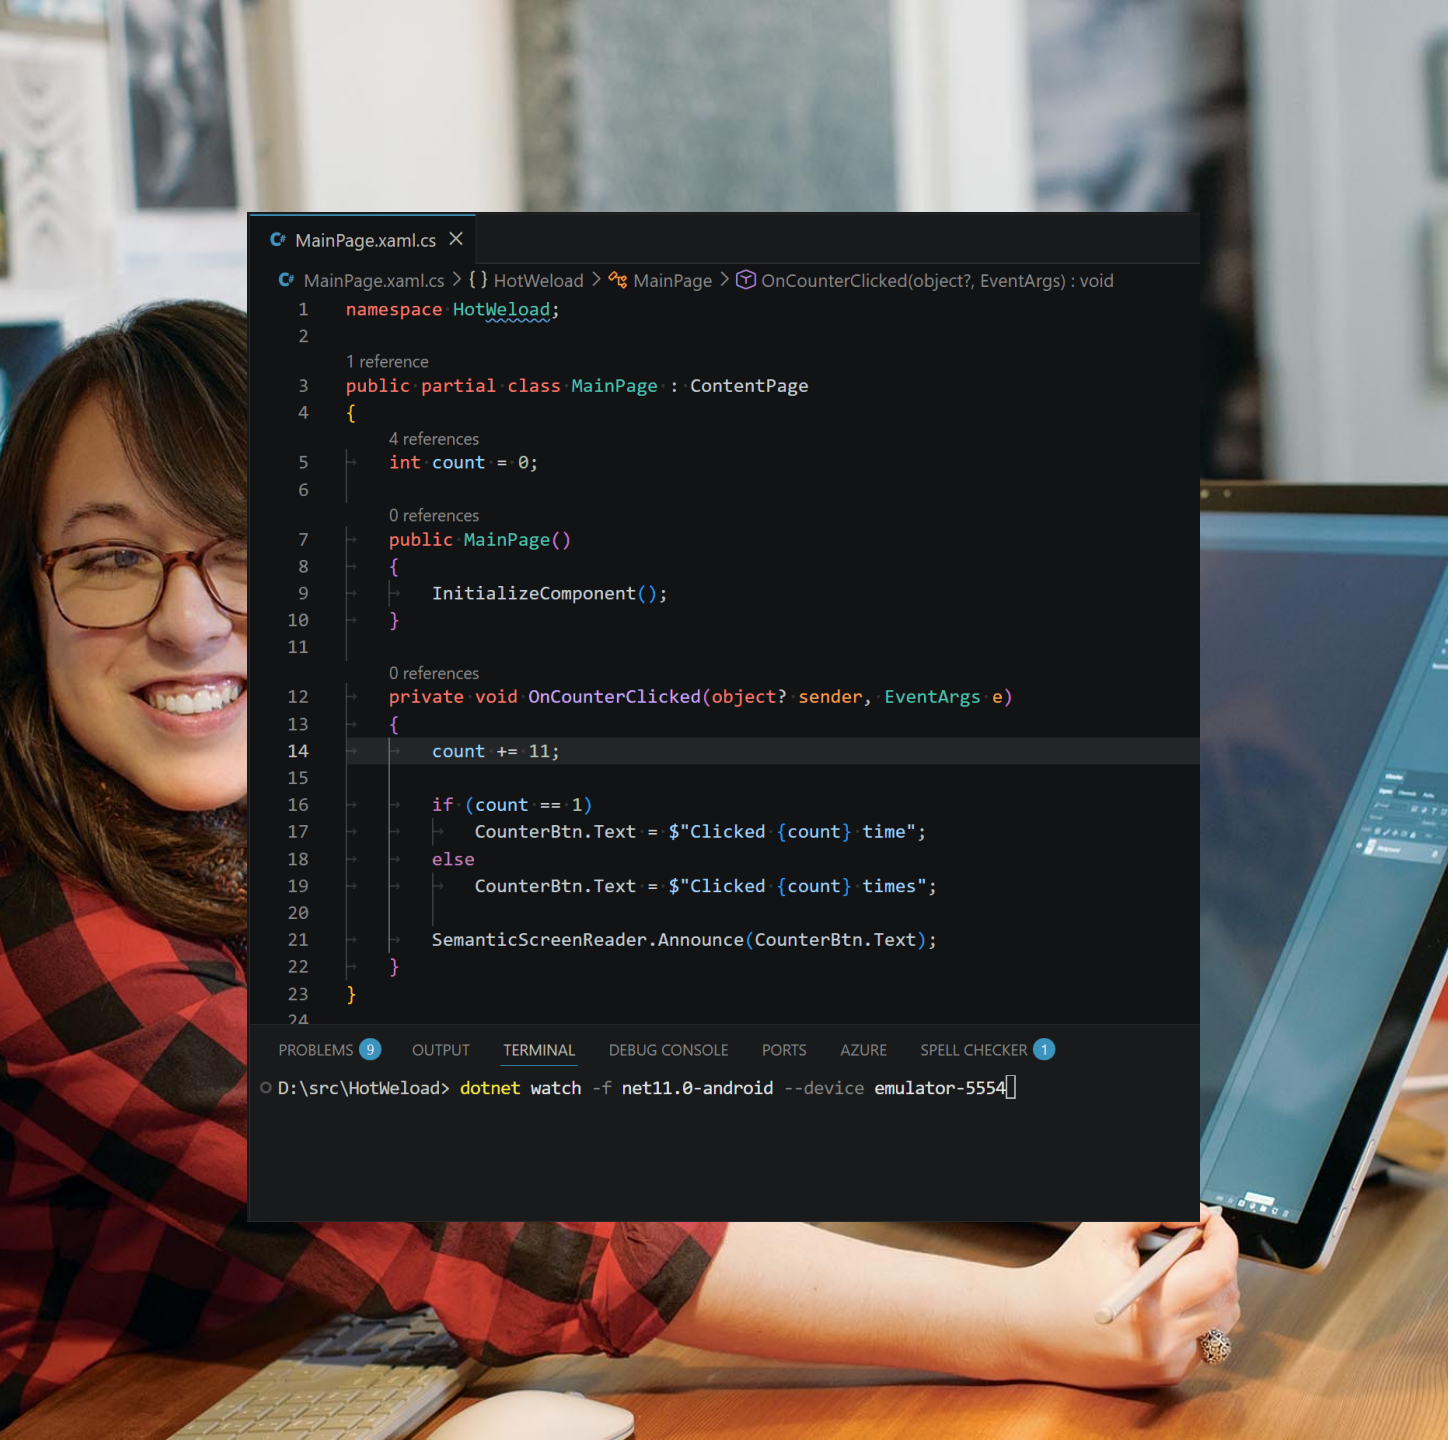

CoreCLR everywhere

In .NET 11, CoreCLR is the runtime for MAUI on Android, iOS, and Mac Catalyst, the same runtime that powers ASP.NET Core and Azure.

You get tiered JIT, ReadyToRun, PGO, and a clear path to NativeAOT.

(only WebAssembly is separate…for now)

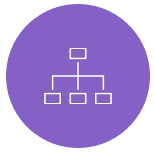

Edit. Save. See it. Everywhere.

dotnet watch and Hot Reload give Blazor Hybrid a web-speed inner loop. Change a Razor component and watch it update live on your phone, your desktop, and the web at once.

DevFlow: drive your app, and your agents

maui CLI: build, run, devices

Live visual tree inspection

On-demand screenshots

CDP bridge for WebViews

MCP server for AI agents

Network capture and profiling

Streamed logs and events

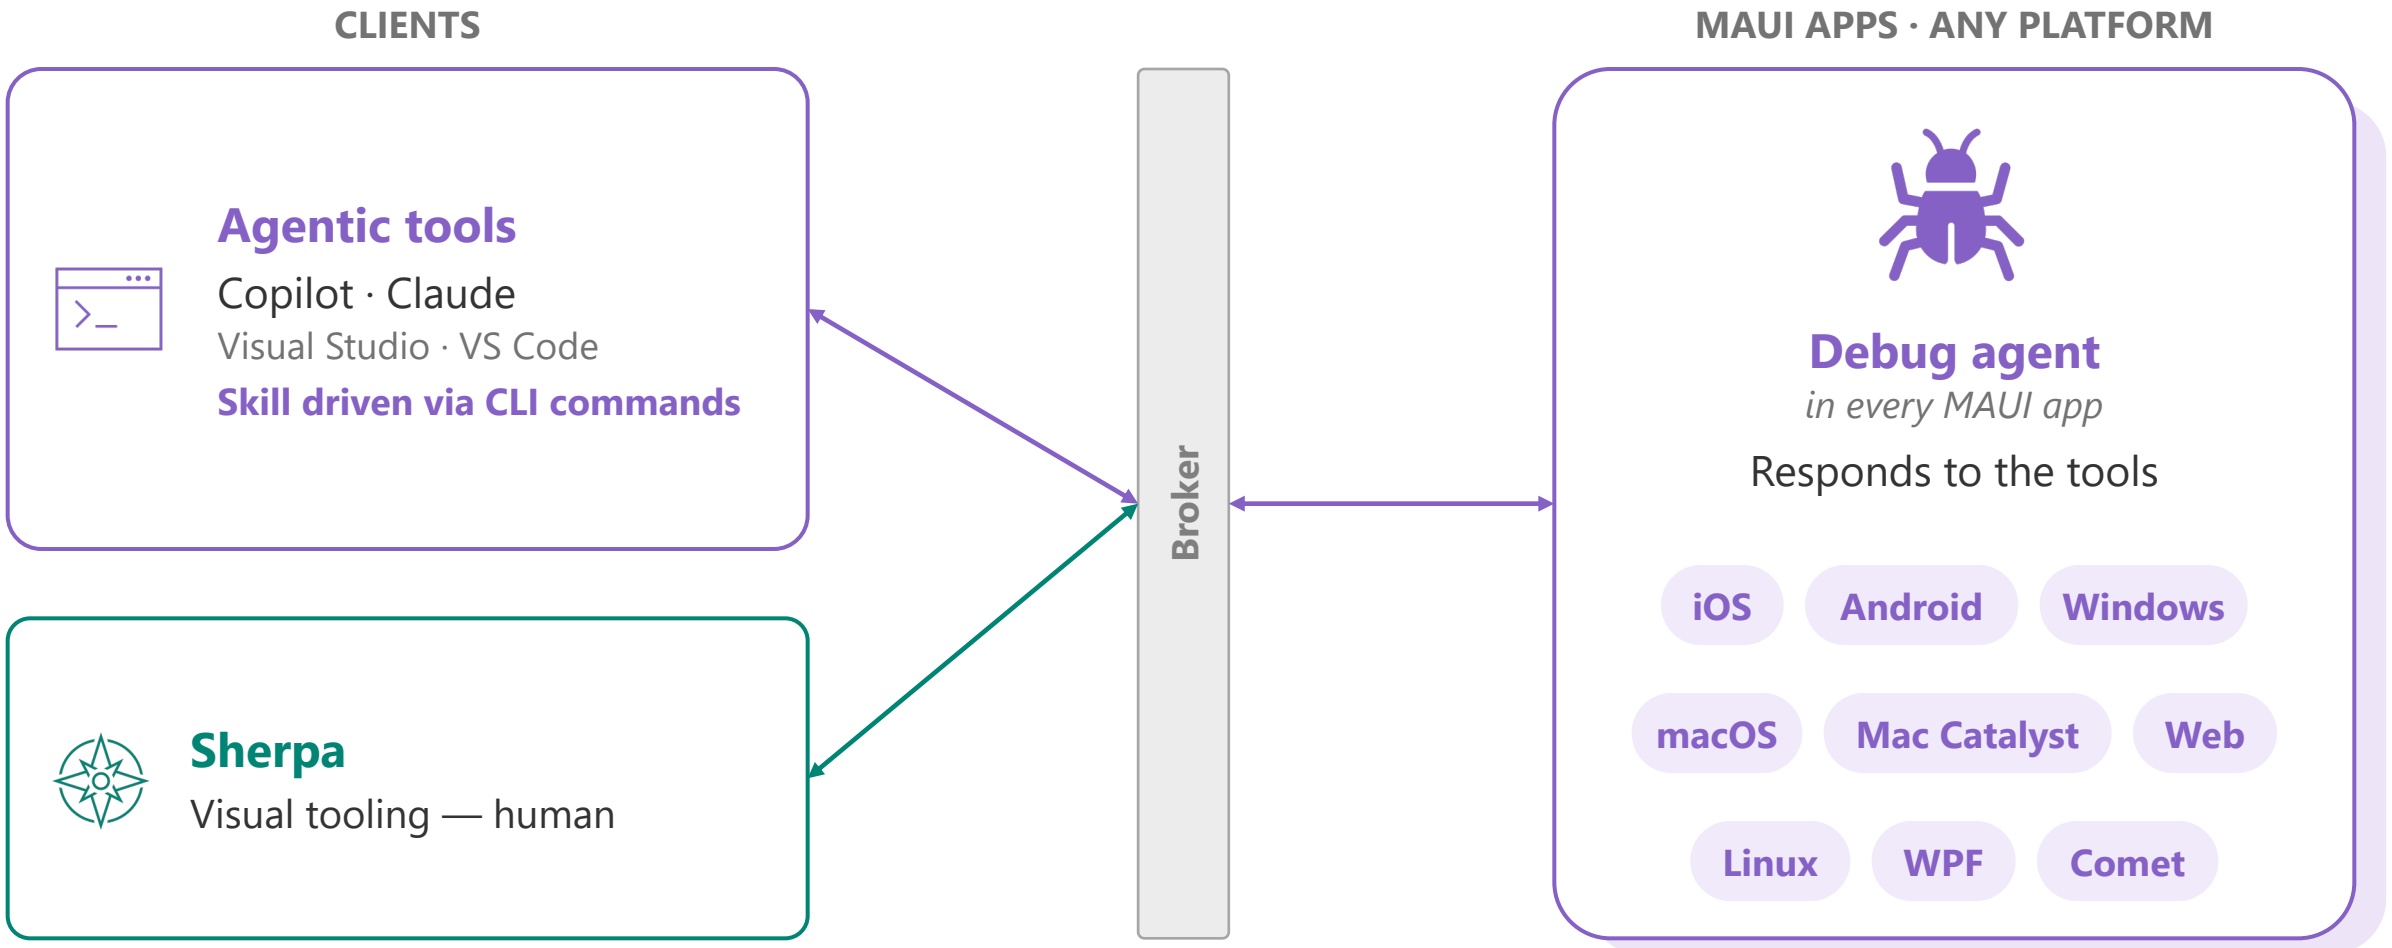

Drivers for every backend, incl. Linux/GTK

CPD – Chrome DevTools | MCP – Model Context Protocol | CLI – Command Line Interface | GTK – GIMP Toolkit | AI – You Can Call Me

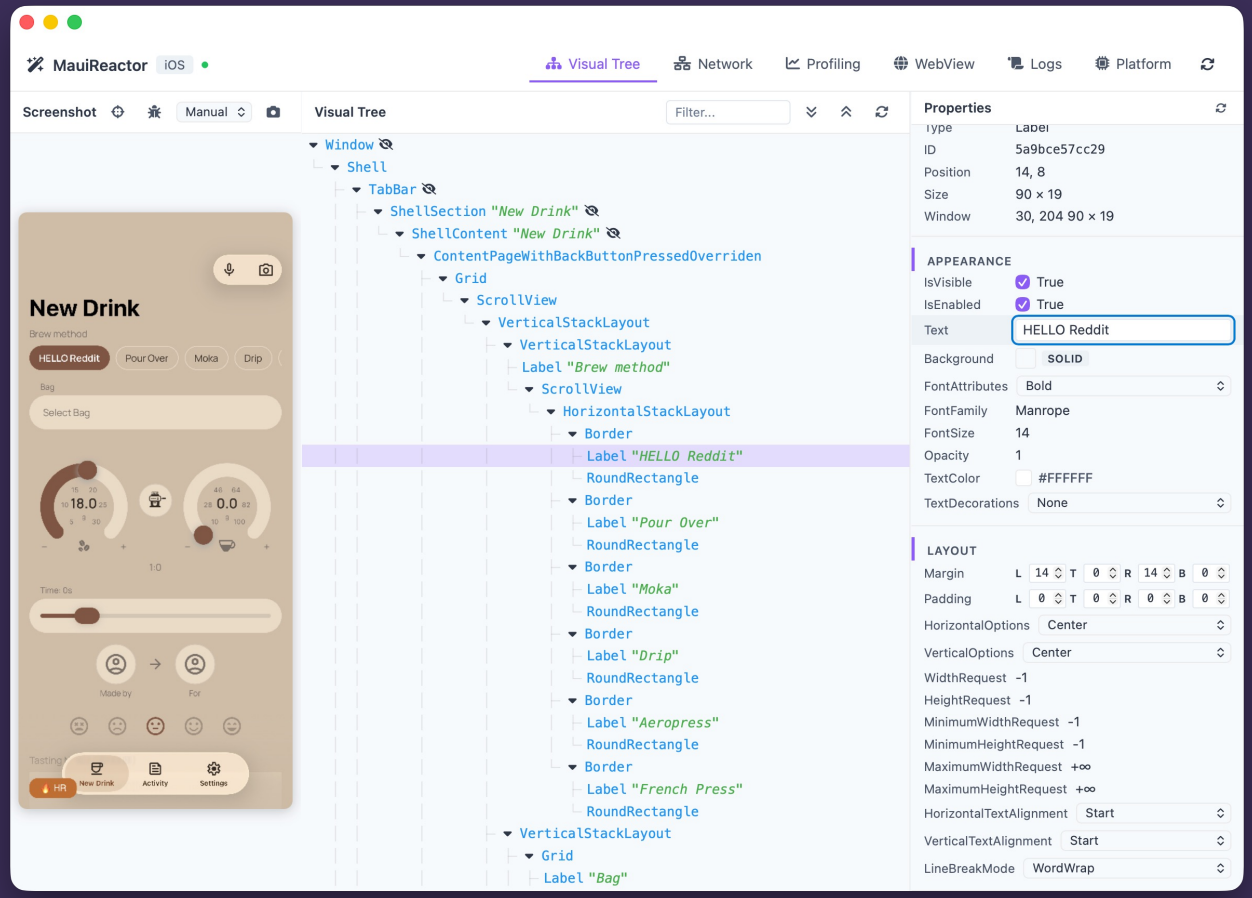

MAUI DevFlow

Agents observe and drive your MAUI app — **less human in the loop.**

github.com/dotnet/maui-labs · github.com/redth/MAUI.Sherpa

MAUI Sherpa

Sherpa manages your whole MAUI setup, Android SDKs, Apple tooling, emulators, and signing, with a live app inspector and GitHub Copilot built in.

The twist: Sherpa is itself a Blazor Hybrid app, shipping to Windows, macOS, and Linux.

Blazor for reach. MAUI for depth. .NET for all of it.

Ideate in the browser. Ship to every screen. Put GitHub Copilot in the loop.

One set of skills, one codebase, reaching everywhere your users are.

Get started in three steps

Install

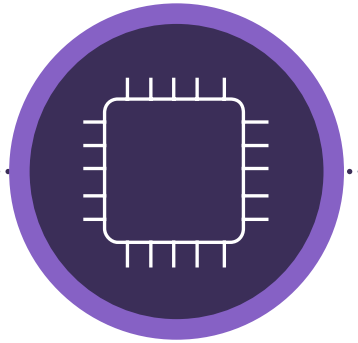

Add the .NET MAUI workload and the maui CLI

Create

dotnet new maui-blazor-web

Run

Add DevFlow, then F5 to web, desktop, and mobile
